#### EXECUTIVE SUMMARY

ATC Group Services LLC. has completed a survey on December 15, 2016 for asbestos containing materials (ACM), lead containing paints (LCP) in building materials, and a visual inspection for Other Hazardous Materials (OHMs) at the Wheeler Library located at 49 East Main Street in Orange, Massachusetts. The survey was performed to identify regulated materials that may be disturbed during proposed renovation activities. Survey findings for the subject site are presented in the body of this report.

ATC collected 52 bulk samples of suspect Asbestos Containing Materials (ACM) from the interior and exterior of the building. These samples were analyzed by an accredited laboratory for asbestos content. Analytical results indicate multiple samples represents building materials that are ACM or are presumed to contain asbestos. Findings are presented in Table 3.1.A (Asbestos Containing) and 3.1.B (No Asbestos Detected)

ATC collected nine paint chip bulk samples from various painted surfaces throughout interior and exterior spaces of the building. These samples were analyzed by an accredited laboratory for total lead content. Analytical results did indicate lead was detected in three of the samples collected. Findings are presented in Table 3.2.

ATC inspectors also conducted a visual survey (no sampling) of various hardware, machinery and building systems that may require special handling and/or disposal prior to demolition activities. This included light fixtures/ballasts, and various operating systems that may contain PCB containing oils, mercury or other, recognized hazardous materials. Findings are presented in Table 3.3.

Analytical data sheets for all samples collected are provided as Appendix A.

The following report summarizes the independent conclusions representing ATC's best professional judgment based on information and data available to us during the course of this assignment. Factual information regarding operations, conditions, and test data provided by the Client, owner, or their representative has been assumed to be correct and complete. Additionally, the conclusions presented are based on the conditions that existed at the time of the assessment.

#### 1.0 INTRODUCTION

This survey was performed at the request of Mr. Daniel Pallota and Mr. Robert Todisco of P3 Project Planning Professionals for the purpose of identifying hazardous building materials that may be impacted during the proposed renovation/demolition of various areas throughout the Wheeler Library located 49 East Main Street in Orange, Massachusetts.

Regulatory requirements and survey practices applicable to demolition projects in Massachusetts are as follows, but not limited to the following:

#### Asbestos

- The United States Environmental Protection Agency (USEPA) National Emissions Standard for Hazardous Air Pollutants (NESHAPs, 40 CFR 61, Subpart M) requires facilities be inspected by competent persons for the presence of asbestos containing materials (ACM) which could or will be disturbed during renovation, construction and demolition activities. Where quantities of ACM exceed 160 square feet or 260 linear feet, asbestos abatement (removal) is required.
- > The Massachusetts Department of Environmental Protection (MADEP) additionally regulates ACM under 310 CMR 7.15 & 310 CMR 19.061.
- > The Massachusetts Department of Labor and Workforce Development, Department of Occupational Safety (MA DLWD-DOS) regulates asbestos worker protection and work practices under 453 CMR 6.00
- The Occupational Safety and Health Administration (OSHA) regulates asbestos worker protection under 29 CFR 1926.1101

#### Lead

- ➤ Lead containing materials in a demolition stream have the potential to create a D008 Listed hazardous waste under 40 CFR Part 760 and 310 CRM 30.
- > The Occupational Safety and Health Administration (OSHA) regulates construction worker exposure to any amount of lead under 29 CFR 1926.62.

#### Hazardous Materials/Universal Wastes

Handling, Transportation & Disposal of hazardous materials including asbestos, lead, PCBs, Universal Wastes and other disposal ban items is regulated by the USEPA, USDOT, and MADEP.

#### 1.1 LIMITATIONS

The term "non-destructive sampling method" refers to a method of collecting samples that does not significantly impact interior or exterior finishes of the building. Surveys for the presence of ACM are therefore limited to those materials accessible by non-destructive sampling methods. ACM may be present in materials not accessible by this sampling methodology, and may be encountered during renovation or demolition of the structure. The term "destructive sampling method" refers to the method of collecting samples that would require destruction of various building systems (i.e. wall cavities, ceilings, flooring materials, roofing) for the purpose of locating hidden heating, plumbing, or other building components that may contain ACM. Destructive methods are recommended for properties slated for demolition. Additional limitations may exist for both destructive and non-destructive sampling methods. Certain locations of the building may be physically inaccessible, or inaccessible due to electrical, mechanical, structural, or other hazards which might exist in the structure at the time of the survey.

Suspect ACM and/or LCP subsequently identified or encountered in physically inaccessible areas during demolition and/or demolition activities and not listed in this report should be assumed to contain asbestos, and/or lead unless testing confirms otherwise.

Observations and sampling of the roofing materials was limited due to the build-up of ice and snow on the flat and pitched sections of the roof. No samples were collected of any flashing compounds or asphalt shingles. ATC inspectors observed and sampled what appeared to be residual tar and gravel roofing around the roof hatch. It cannot be definitively stated that all materials on the flat roof sections are homogenous in nature. Additional roof sampling of the flat and pitched sections of the roof will be necessary prior to those materials being disturbed during renovation/demolition. No subsurface inspection or assessment was performed, the possible presence of below grade dampproofing and/or piping may be present and should be determined prior to potential disturbance and/or design.

The following areas were not included in the scope of work at the time of this evaluation.

- Materials only accessible through structural demolition including within walls and above fixed ceilings;
- Fire doors;
- Roofing;
- Below grade;
- · Materials entombed or beneath concrete; and
- Materials associated with functioning MEP systems.

#### 2.0 METHODS AND MATERIALS

#### 2.1 ASBESTOS

Samples were collected per regulations governing asbestos surveys. Samples were placed into plastic bags with an air tight seal. Labels were affixed to the sample bags with specific nomenclature.

Bulk samples were analyzed by Polarized Light Microscopy (PLM) using the United States Environmental Protection Agency USEPA/600/R-93/116 method. Sample analysis was conducted by ProScience Analytical Services, Inc., 22 Cummings Park, Woburn, Massachusetts (NVLAP Accreditation 2000090-0).

There are six minerals grouped into the term "asbestos." Chrysotile, amosite, and crocidolite are the asbestos minerals most commonly found in building materials. ACM is defined as a material containing more than one percent (1%) asbestos by weight. ACBM is a subset of materials in the group ACM and are considered to be ACM that is found in or on interior structural members of a building. Materials found to be asbestos containing are listed in Section 3.0. Exact sample compositions are included in the laboratory reports or chains of custody found in Appendix A.

Types, locations, estimated quantities, and conditions of ACM are shown on Table 3.1.A. Suspect materials sampled and found not to contain ACM are found in Table 3.1.B.

Polarized light microscopy (PLM) is the root method used for the identification of ACM. The USEPA Office of Research and Development (USEPA/ORD) has reviewed data from performance audits of various laboratories performing PLM. The results of that review indicated an unacceptable number of false negatives and positives for visual estimation of materials containing less than 10% asbestos. On the basis of those findings the National Emissions Standards Hazardous Air Pollutants (NESHAP) regulations were amended on November 20, 1990 (Federal Register, V.55, and N.224). The revisions state that if the analyst detects asbestos in the sample and estimates the amount to be less than 10% by visual estimation, the parties legally responsible (owner or operator) for the building may (1) elect to assume the amount to be greater than 1% and treat the material as ACM or (2) require verification of the amount by point counting. Point counting is a technique used to quantify the amount of asbestos present in a sample on which PLM has already been performed. ATC recommends point counting re-analysis for asbestos values less than 10%, and where applicable those results are reflected in the report. In instances where client authorization is not received for this re-analysis, PLM visual results indicating a trace or 1% value will be reported as assumed ACM as required by item (1) above

A similar situation exists for matrix bound fibers such as those found in floor tiles, mastics, and asphalt based materials. The organic matrix of these bulk samples may interfere with the identification and quantification of asbestos mineral content. These types of samples are generally referred to as Non-friable organically bound (NOB) materials. Transmission Electron Microscopy (TEM-NOB) is a method that utilizes a combination of special sample preparation techniques and high magnification to quantify asbestos content with greater accuracy than PLM. Currently only the State of New York has regulations requiring TEM-NOB re-analysis of suspect ACM for which negative or trace determination resulted from PLM analysis. Although additional cost is involved, ATC recommends TEM-NOB analysis under certain circumstances, as a state of the art means of evaluation.

#### 2.2 LEAD CONTAINING PAINT (LCP)

ATC collected nine total paint chip samples from painted surfaces within the renovation areas of the building. These samples were subsequently submitted to ProScience Analytical Services, Inc. of Woburn, Massachusetts for total lead concentration determination. Laboratory results indicate the presence of lead was detected in three of the samples collected. Paint chip data is provided in Table 3.2.

The U.S. Department of Housing and Urban Development (HUD) standards (24 CFR Part 35) and the USEPA Toxic Substances Control Act (TCSA) define LCP as layers of paint on an applicable surface having lead equal to or greater than 1.0 milligram per square centimeter (mg/cm²) or 0.5% by dry weight. The OSHA Lead in Construction standard (29 CFR 1926.62) considers any level of lead to be potentially harmful when disturbed during demolition or construction. Various OSHA work practices and worker protection requirements are mandated depending on the nature of the disturbance.

#### 2.3 OTHER HAZARDOUS MATERIALS

Observations of light fixtures/ballasts/transformers, various operating systems that may contain PCBs, mercury, and/or oils were also performed. Representative light fixtures were accessed and the ballasts were inspected for the presence of PCBs. Any mechanical systems encountered during this survey were inspected for leaks or residual staining related to a potential leak of stored oils, PCBs and other internal fluids. Items that may contain coolants or refrigerants include at a minimum, refrigeration and freezer units, and air conditioner units.

Items that may contain mercury include fluorescent lights, thermometers, heating thermostats, and electrical switches. The majority, if not all, of these items are capable of being removed (with appropriate handling methods) intact for proper disposal or reuse.

#### 3.0 RESULTS AND FINDINGS

The results of this survey are presented in tabular form. These tables summarize the nature, distribution and estimated quantity of ACM, LCP and OHM's found during this survey.

Asbestos Containing Materials are found in Table 3.1.A.

Suspect materials sampled and found not contain asbestos are found in Table 3.1.B.

Lead concentrations for bulk samples collected from various painted surfaces are found in Table 3.2.

Other Hazardous Materials (OHMs) information is presented in Table 3.3

Hydraulic door close	Throughout	4 units
Exit sign	Throughout	5 units
Boiler	Boiler room	2 units
Ceiling mounted heaters	Throughout	' 3 units
275 gallon above ground storage tank	Boiler room	2 units

#### 4.0 DISCUSSION AND INTERPRETATION

#### 4.1 ASBESTOS

Response actions are based in part upon our current understanding of area usage or future usage at the time of the survey. Removal is always required where pending demolition will disturb ACM's. Any material discovered in the course of demolition activities, which is not identified in this report, should be presumed to contain asbestos until sampling shows otherwise. Section 1.1 Limitations details areas that were deemed inaccessible or were not included in the scope of work.

#### 4.2 LEAD

The presence of lead associated with various painted surfaces was detected in all of the samples collected. Table 3.2 details locations and results of the materials tested.

#### 4.3 OTHER HAZARDOUS MATERIALS

ECS conducted a visual inspection (no sampling) of various hardware, machinery, and building systems which may require special handling and/or disposal prior to demolition activities. The results of the Other Hazardous Material Inspection are detailed in Table 3.3. The majority, if not all, of these items are capable of being removed (with appropriate handling methods) intact for proper disposal or reuse

#### 5.0 CONCLUSION

Asbestos abatement of items listed in Table 3.1.A will be required prior to any demolition work that would disturb these materials. Additional roof sampling of the flat and pitched sections of the roof will be necessary prior to those materials being disturbed during renovation/demolition. ATC recommends the preparation of an asbestos abatement specification to define work practice requirements in these areas.

OSHA lead regulations will apply to any demolition operation (i.e. sanding, scraping, cutting, and welding) that would disturb painted surfaces which contain lead. ATC recommends the preparation of a LCP handling specification to define work practice requirements in these areas.

Disposal of materials coated with paint containing lead is subject to the USEPA RCRA regulations. At the present time, federal and state regulations do not necessarily require that materials coated with lead-based paint be removed prior to demolition. However, wastes generated are required to be characterized prior to disposal. ATC recommends that TCLP testing be performed on the waste stream generated from demolition activities performed at the property inspected.

Other Hazardous Materials are listed in Table 3.3 and should be removed before any demolition and/or demolition activities impact these materials. ATC recommends the preparation of a specification defining the handling and disposal of these materials.

Unless otherwise indicated, all samples were received in acceptable condition.

All result apply only to the samples as received and are accurate to no more than two significant figures.

Unless otherwise indicated, all the quality control criteria for the method above have been met.

RL-Reporting Limit(%by weight)

Note on units: mg/Kg is the same as ppm by weight.
